SN54176, SN54177, SN74176, SN74177 35-MHz PRESETTABLE DECADE AND BINARY COUNTERS/LATCHES

MAY 1971—REVISED MARCH 1988

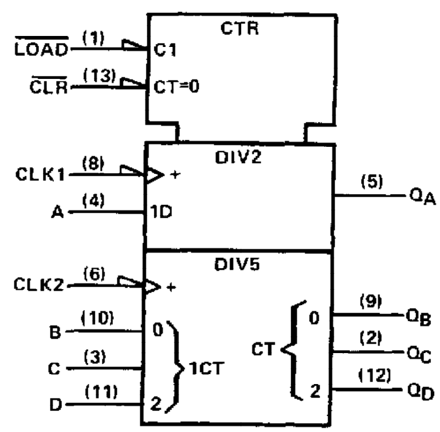

- Reduced-Power Versions of SN54196, SN54197, SN74196, and SN74197 50-MHz Counters
- D-C Coupled Counters Designed to Replace Signetics 8280, 8281, 8290, and 8291 Counters in Most Applications
- Performs BCD, Bi-Quinary, or Binary Counting
- Fully Programmable
- Fully Independent Clear Input
- Counts at Input Frequencies from 0 to 35 MHz
- Input Clamping Diodes Simplify System Design

description

These high-speed monolithic counters consist of four d-c coupled master-slave flip-flops which are internally interconnected to provide either a divide-by-two and a divide-by-five counter (SN54176, SN74176) or a divide-by-two and a divide-by-eight counter (SN54177, SN74177). These counters are fully programmable; that is, the outputs may be preset to any state by placing a low on the count/load input and entering the desired data at the data inputs. The outputs will change to agree with the data inputs independent of the state of the clocks.

These counters may also be used as 4-bit latches by using the count/load input as the strobe and entering data at the data inputs. The outputs will directly follow the data inputs when the count/load is low, but will remain unchanged when the count/load is high and the clock inputs are inactive.

These high-speed counters will accept count frequencies of 0 to 35 megahertz at the clock-1 input and 0 to 17.5 megahertz at the clock-2 input. During the count operation, transfer of information to the outputs occurs on the negative-going edge of the clock pulse. The counters feature a direct clear which when taken low sets all outputs low regardless of the states of the clocks.

All inputs are diode-clamped to minimize transmission-line effects and simplify system design. The circuits are compatible with most TTL logic families. Typical power dissipation is 150 milliwatts. The SN54176 and SN54177 circuits are characterized for operation over the full military temperature range of −55 °C to 125 °C; the SN74176 and SN74177 circuits are characterized for operation from 0 °C to 70 °C.

PRODUCTION DATA documents contain information current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

typical count configurations

SN54176 and SN74176

The output of flip-flop A is not internally connected to the succeeding flip-flops; therefore, the count may be operated in three independent modes:

1. When used as a binary-coded-decimal decade counter, the clock-2 input must be externally connected to the Q_A output. The clock-1 input receives the incoming count, and a count sequence is obtained in accordance with the BCD count sequence function table shown at right.
2. If a symmetrical divide-by-ten count is desired for frequency synthesizers (or other applications requiring division of a binary count by a power of ten), the Q_D output must be externally connected to the clock-1 input. The input count is then applied at the clock-2 input and a divide-by-ten square wave is obtained at output Q_A in accordance with the bi-quinary function table.
3. For operation as a divide-by-two counter and a divide-by-five counter, no external interconnections are required. Flip-flop A is used as a binary element for the divide-by-two function. The clock-2 input is used to obtain binary divide-by-five operation at the Q_B, Q_C, and Q_D outputs. In this mode, the two counters operate independently; however, all four flip-flops are loaded and cleared simultaneously.

SN54177 and SN74177

The output of flip-flop A is not internally connected to the succeeding flip-flops, therefore the counter may be operated in two independent modes:

1. When used as a high-speed 4-bit ripple-through counter, output Q_A must be externally connected to the clock-2 input. The input count pulses are applied to the clock-1 input. Simultaneous divisions by 2, 4, 8, and 16 are performed at the Q_A, Q_B, Q_C, and Q_D outputs as shown in the function table at right.
2. When used as a 3-bit ripple-through counter, the input count pulses are applied to the clock-2 input. Simultaneous frequency divisions by 2, 4, and 8 are available at the Q_B, Q_C, and Q_D outputs. Independent use of flip-flop A is available if the load and clear functions coincide with those of the 3-bit ripple-through counter.
